

Meeting minutes: 20 minutes

User stories:

Core Hardware Monitoring & Sensors

Focus: Backend sensor integration and data collection

As a PC enthusiast, I want to view real-time CPU temperature, usage, and clock speed in a customizable dashboard so that I can monitor my system's performance at a glance.

As a gamer, I want to see GPU metrics (temperature, usage, memory, clock speeds) overlaid on my screen while gaming so that I can ensure my hardware isn't overheating during intensive sessions.

As a system administrator, I want to monitor multiple hardware components (CPU, GPU, RAM, storage, network) simultaneously in one interface so that I can quickly identify bottlenecks or issues.

As a overclocker, I want to track voltage readings and power consumption for my CPU and GPU so that I can safely push my hardware to its limits.

As a non-technical user, I want the app to auto-detect all my hardware components and display relevant metrics so that I don't need to manually configure sensors.

User Interface & Visualization

Focus: Dashboard UI, widgets, and visual components

As a creative user, I want to drag and drop widgets to arrange my monitoring dashboard layout so that I can organize information according to my preferences.

As a minimalist user, I want to create a compact, floating overlay with only essential metrics so that it doesn't obstruct my workflow or gaming.

As a theme enthusiast, I want to customize colors, fonts, and visual styles of my monitoring interface so that it matches my desktop aesthetic.

As a user with multiple monitors, I want to position monitoring widgets on any screen so that I can utilize my display space efficiently.

As a visual learner, I want to choose between different visualization types (gauges, graphs, numbers, bars) for each metric so that I can view data in the most intuitive format for me.

Configuration Management & User Experience

Focus: Profiles, templates, import/export, and ease of setup

As a beginner, I want to use pre-built dashboard templates so that I can start monitoring my hardware immediately without configuration.

As a community member, I want to import and export dashboard configurations so that I can share my layouts with others or try popular community designs.

As a user switching from AIDA64, I want a migration wizard that helps me recreate my AIDA64 layout in HMT so that I can transition smoothly.

As a power user, I want to save multiple dashboard profiles and switch between them quickly so that I can have different layouts for gaming, work, and benchmarking.

As a troubleshooter, I want to see detailed hardware information (model numbers, drivers, firmware versions) alongside metrics so that I can diagnose compatibility issues.

Data Management & Advanced Features

Focus: Data logging, historical data, alerts, and exports

As a user, I want to view historical data graphs for temperature and usage metrics so that I can identify patterns and trends over time.

As a data analyst, I want to export monitoring data to CSV or JSON format so that I can perform detailed analysis or create custom reports.

As a concerned user, I want to set up alerts that notify me when temperatures or usage exceed defined thresholds so that I can prevent hardware damage.

As a hardware tester, I want to log sensor data continuously in the background so that I can review performance during long-running stress tests.

As a remote worker, I want to access my hardware metrics through a web interface on my local network so that I can monitor my workstation from anywhere in my home.

System Integration & Extensibility

Focus: Performance optimization, startup behavior, plugins, and documentation

As a performance-conscious user, I want HMT to use minimal system resources (CPU, RAM) so that monitoring doesn't impact my applications or games.

As a user, I want the app to start with Windows and begin monitoring automatically so that I always have access to my metrics without manual intervention.

As a stability-focused user, I want the app to gracefully handle sensor failures or hardware disconnections so that my monitoring continues for other components.

As a Python developer, I want to create custom widgets or plugins using a documented API so that I can extend HMT's functionality for my specific needs.

As an open-source contributor, I want clear documentation on the app's architecture and contribution guidelines so that I can help improve HMT and add support for new hardware sensors.

People in the meeting:

Santiago Defelice - Team Leader - Structure and Starter code CPU

Justin Wissart - GPU - Fan speed & clock

Daniel Adiazola - GPU - temp & load percentage

Jonathan Gonzalez - Storage - usage percentage & read/write

Louis Flores RAM - RAM utilization & speed / Debugging
