

Meeting minutes: 10 minutes

Topic: Review sprint 3

We have split the user stories into sections and each team member must choose one user story from another section to work on to enable more pair programming. We will review on monday during stand up.

Advanced Monitoring Features

Focus: Enhanced sensor capabilities, predictive analytics, and specialized monitoring

As a content creator, I want to monitor disk queue length and SSD health metrics (TBW, wear leveling) so that I can predict drive failures before losing important data.

As a laptop user, I want to see battery health statistics (cycle count, capacity degradation, estimated lifespan) so that I can plan for battery replacement.

As an overclocker, I want to monitor individual CPU core temperatures and frequencies so that I can identify which cores are thermal throttling.

As a system builder, I want to track motherboard sensor data (VRM temperatures, chipset temp, BIOS version) so that I can ensure all components are operating safely.

As a network administrator, I want to monitor network adapter statistics (packet loss, errors, bandwidth utilization) so that I can troubleshoot connectivity issues.

Gaming & Performance Optimization

Focus: Gaming-specific features, FPS monitoring, and performance tuning

As a competitive gamer, I want to see frame time graphs and 1% low FPS alongside average FPS so that I can identify stuttering issues.

As a streamer, I want to monitor encoder performance (dropped frames, encoding lag) alongside hardware metrics so that I can optimize stream quality.

As a VR user, I want to track frame timing and reprojection rates so that I can ensure smooth VR experiences without motion sickness.

As a benchmark enthusiast, I want to compare my hardware metrics against community averages for the same hardware so that I can validate my system's performance.

As a gamer, I want automatic game detection that switches to a minimal overlay profile when games launch so that monitoring doesn't interfere with gameplay.

Automation & Smart Features

Focus: AI-driven insights, automated responses, and predictive maintenance

As a busy professional, I want HMT to automatically generate weekly performance reports with insights and recommendations so that I can maintain my system without constant monitoring.

As a thermal-conscious user, I want automatic fan curve adjustments based on temperature trends so that my system stays cool while minimizing noise.

As a power user, I want to schedule performance profiles that automatically activate based on time of day or running applications so that I can optimize for work or gaming contexts.

As a hardware enthusiast, I want machine learning-based anomaly detection that alerts me to unusual hardware behavior so that I can catch problems early.

As a user, I want HMT to provide optimization suggestions (driver updates, thermal paste replacement) based on my hardware's performance trends so that I can maintain peak performance.

Cross-Platform & Remote Access

Focus: Mobile apps, cloud sync, and remote monitoring capabilities

As a mobile user, I want a companion mobile app that shows my PC's metrics in real-time so that I can monitor my system while away from my desk.

As a user with multiple PCs, I want to monitor all my systems from a single dashboard so that I can manage my entire hardware ecosystem.

As a remote worker, I want to receive push notifications on my phone when critical alerts trigger so that I can respond to hardware issues immediately.

As a tech-savvy user, I want to integrate HMT with home automation systems (Home Assistant, MQTT) so that I can trigger actions based on hardware states.

As a cloud-conscious user, I want optional cloud backup of my historical data and dashboard configurations so that I never lose my monitoring setup.

Social & Community Features

Focus: Sharing, competition, and community engagement

As a hardware reviewer, I want to generate shareable performance cards with my hardware specs and metrics so that I can showcase system performance on social media.

As a competitive user, I want leaderboards that rank hardware configurations by benchmark scores so that I can see how my system compares globally.

As a helpful community member, I want to share diagnostic snapshots (sanitized system info + metrics) so that I can get troubleshooting help from forums.

As a modder, I want to browse and rate community-created dashboard themes and widgets so that I can discover the best visual designs.

As a tutorial creator, I want to record and export monitoring sessions with annotations so that I can create educational content about hardware performance.

Santiago Defelice - Team Leader - Structure and Starter code CPU

Justin Wissart - GPU - Fan speed & clock

Daniel Adriazola - GPU - temp & load percentage

Jonathan Gonzalez - Storage - usage percentage & read/write

Louis Flores RAM - RAM utilization & speed / Debugging
